

# SQL DATA TYPES & **OPERATIONS**

By the end of this lecture students should be able to:

- ✓ Understand about the different types of data we can collect
- ✓ Use these data types while creating your tables
- ✓ Choose a appropriate data type for a table column based on your requirement
- ✓ Use operators to specify conditions in an SQL statement

**!= or <>**

# Table of contents

- ◇ **Ms SQL Server Data Types**
- ◇ **SQL Operators**

## Section 1

# MS SQL SERVER DATA TYPES

## Student:

- ✓ Name
- ✓ Birthday
- ✓ Gender
- ✓ Address
- ✓ Marks...

***What type of data each of field ???.....***

➤ **SQL Server supports below data types. NULL is default value for most data type:**

- ✓ Exact Numerics
- ✓ Approximate Numerics
- ✓ Date and Time
- ✓ Character Strings
- ✓ Unicode Character Strings
- ✓ Binary Strings
- ✓ Other Data Types

## ➤ *Integer-based data type*

| Data type       | Size    | Range of values           |
|-----------------|---------|---------------------------|
| <b>Bigint</b>   | 8 Bytes | $-2^{63}$ to $2^{63}-1$   |
| <b>Int</b>      | 4 Bytes | $-2^{31}$ to $2^{31}-1$   |
| <b>Smallint</b> | 2 Bytes | $-2^{15}$ to $2^{15} - 1$ |
| <b>Tinyint</b>  | 1 Byte  | 0 to 255                  |
| <b>Bit</b>      | 1 Bit   | 0 to 1                    |

## *Exact decimal-based data type*

| Data type   | Size                                     | Range of values   |
|---|--|---|
| <b>Decimal(p,s)</b>   | 5 - 17 Bytes<br>(depending on precision) | - Varies based on precision setting.<br>- Maximum values are $-10^{38} + 1$ through $10^{38} - 1$ |
| <i>(p is the maximum number of all digits (both sides of the decimal point), s is the maximum number of digits after the decimal point)</i> |  |   |
| <b>Numeric(p,s)</b>   | ...                                      | Identical to <b>Decimal type</b>  |
| <b>Smallmoney</b>   | 4 Bytes                                  | - 214,748.3648 to 214,748.3647  |
| <b>Money</b>  | 8 Bytes                                  | - 922,337,203,685,477.5808<br>To<br>922,337,203,685,477.5807                                      |

| Data type                        | Size   | Range of values                     |
|----------------------------------|--|-------------------------------------|
| Float                            | 8 Bytes  | - 1.79E+308 to 1.79E+308            |
| <i>Depends on the value of n</i> |  |                                     |
| Float(n)                         | If $1 \leq n \leq 24$ : 4 Bytes<br>(Precision: 7 digits)   | 4 Bytes: - 3.40E + 38 to 3.40E + 38 |
|                                  | If $25 \leq n \leq 53$ : 8 Bytes<br>(Precision: 15 digits) | 8 Bytes: - 1.79E+308 to 1.79E+308   |
| Real                             | ...  | - 3.40E + 38 to 3.40E + 38          |

**Note:** SQL Server treats  $n$  as one of two possible values. If  $1 \leq n \leq 24$ ,  $n$  is treated as **24**. If  $25 \leq n \leq 53$ ,  $n$  is treated as **53**.

| Data Type             | Description  | Example                            |
|-----------------------|--|------------------------------------|
| <b>Date</b>           | Stores dates between January 1, 0001, and December 31, 9999  | 2008-01-15                         |
| <b>Datetime</b>       | Stores dates and times between January 1, 1753, and December 31, 9999, with an accuracy of 3.33 milliseconds | 2008-01-15 09:42:16.142            |
| <b>Datetime2</b>      | Stores date and times between January 1, 0001, and December 31, 9999, with an accuracy of 100 nanoseconds    | 2008-01-15 09:42:16.1420221        |
| <b>Datetimeoffset</b> | Similar to the datetime2 data type, but also expects an offset designation of -14:00 to +14:00               | 2008-01-15 09:42:16.1420221 +05:00 |
| <b>Smalldatetime</b>  | Stores dates and times between January 1, 1900, and June 6, 2079, with an accuracy of 1 minute               | 2008-01-15 09:42:00                |
| <b>Time</b>           | Stores times with an accuracy of 100 nanoseconds   | 09:42:16.1420221                   |

## Non-Unicode string data types:

| Data type           | Description   |
|---------------------|---|
| <b>Char(n)</b>      | <ul style="list-style-type: none"><li>- Fixed-length</li><li>- Maximum length of 8,000 characters (<math>1 \leq n \leq 8000</math>)</li></ul>             |
| <b>Varchar(n)</b>   | <ul style="list-style-type: none"><li>- Variable-length</li><li>- Maximum of 8,000 characters (<math>1 \leq n \leq 8000</math>)</li></ul>                 |
| <b>Varchar(max)</b> | <ul style="list-style-type: none"><li>- Variable-length</li><li>- Maximum length of 2,147,483,647 characters</li></ul>                                    |
| <b>Text</b>         | <ul style="list-style-type: none"><li>- Variable-length</li><li>- Maximum length of 2,147,483,647 characters</li><li>- Use varchar(max) instead</li></ul> |

Unicode string data types are “double width”:

| Data type            | Description  |
|----------------------|--|
| <b>Nchar(n)</b>      | <ul style="list-style-type: none"><li>- Fixed-length</li><li>- Maximum specified length is 4,000 characters (<math>1 \leq n \leq 4000</math>)</li></ul>    |
| <b>Nvarchar(n)</b>   | <ul style="list-style-type: none"><li>- Variable-length</li><li>- Maximum specified length is 4,000 characters (<math>1 \leq n \leq 4000</math>)</li></ul> |
| <b>Nvarchar(max)</b> | <ul style="list-style-type: none"><li>- Variable-length</li><li>- Maximum length of 1,073,741,823 characters</li></ul>                                     |
| <b>Ntext</b>         | <ul style="list-style-type: none"><li>- Variable-length</li><li>- Maximum length of 1,073,741,823 characters</li></ul>                                     |

| Data type | Description  |
|-----------|--|
| Binary    | <ul style="list-style-type: none"><li>- Fixed-length binary data</li><li>- Maximum length of 8,000 bytes</li></ul>             |
| Varbinary | <ul style="list-style-type: none"><li>- Variable length binary data</li><li>- Maximum length of 8,000 bytes.</li></ul>         |
| Image     | <ul style="list-style-type: none"><li>- Variable length binary data</li><li>- Maximum length of 2,147,483,647 bytes.</li></ul> |

| Data Type               | Description  |
|-------------------------|--|
| <b>Timestamp</b>        | Stores a database-wide unique number that gets updated every time a row gets updated           |
| <b>Hierarchyid</b>      | Special data type that maintains hierarchy positioning information                             |
| <b>Uniqueidentifier</b> | Stores a database-wide unique number that gets updated every time a row gets updated           |
| <b>Sql_variant</b>      | Stores values of various SQL Server-supported data types, except text, ntext, and timestamp    |
| <b>Xml</b>              | Stores XML data. You can store xml instances in a column or a variable (SQL Server 2005 only). |
| <b>Table</b>            | Stores a result set for later processing   |

## Section 2

# SQL OPERATORS

# What is an Operator in SQL?

- An **operator** is a reserved word or a character used primarily in an SQL statement's WHERE clause to perform operation(s), such as comparisons and arithmetic operations.
- Operators are used to specify conditions in an SQL statement and to serve as conjunctions for multiple conditions in a statement. Some types of most operators:
  - 1 Arithmetic operators
  - 2 Comparison operators
  - 3 Logical operators.

- Here is a list of the Arithmetic operators available in SQL

| Operator | Description    | Example                 |
|----------|----------------|-------------------------|
| +        | Addition       | $a + b \rightarrow 30$  |
| -        | Subtraction    | $a - b \rightarrow -10$ |
| *        | Multiplication | $a * b \rightarrow 200$ |
| /        | Division       | $b / a \rightarrow 2$   |
| %        | Modulus        | $b \% a \rightarrow 0$  |

( Assume variable **a** holds **10** and variable **b** holds **20**)

➤ Here is a list of all the Comparison operators available in SQL

| Operator | Description  | Operator | Description              |
|----------|--------------|----------|--------------------------|
| =        | equal to     | >=       | greater than or equal to |
| !=, <>   | not equal to | <=       | less than or equal to    |
| <        | less than    | !<       | not less than            |
| >        | greater than | !>       | not greater than         |

## ❑ Example

| ID | NAME     | AGE | ADDRESS   | SALARY   |
|----|----------|-----|-----------|----------|
| 1  | Ramesh   | 32  | Ahmedabad | 2000.00  |
| 2  | Khilan   | 25  | Delhi     | 1500.00  |
| 3  | kaushik  | 23  | Kota      | 2000.00  |
| 4  | Chaitali | 25  | Mumbai    | 6500.00  |
| 5  | Hardik   | 27  | Bhopal    | 8500.00  |
| 6  | Komal    | 22  | MP        | 4500.00  |
| 7  | Muffy    | 24  | Indore    | 10000.00 |

CUSTOMERS TABLE

*SQL: SELECT \* FROM CUSTOMERS WHERE SALARY > 5000;*

| ID | NAME     | AGE | ADDRESS | SALARY   |
|----|----------|-----|---------|----------|
| 4  | Chaitali | 25  | Mumbai  | 6500.00  |
| 5  | Hardik   | 27  | Bhopal  | 8500.00  |
| 7  | Muffy    | 24  | Indore  | 10000.00 |

| Operator   | Description   |
|------------|---|
| ALL        | • Used to compare a value to all values in another value set.                               |
| <b>AND</b> | • <b>Used when both conditions are included</b>   |
| ANY        | • Used to compare a value to any applicable value in the list according to the condition    |
| BETWEEN    | • Used to limit the values in a range e.g.  |
| EXISTS     | • Used to search for the presence of a row in a specified table that meets certain criteria |
| IN         | • Included in the list e.g.   |
| LIKE       | • Equal to some character (use quotes)  |
| <b>NOT</b> | • <b>Opposite of the logical value</b>  |
| <b>OR</b>  | • <b>Used when either of the condition is true</b>  |
| IS NULL    | • This checks if the field has a null   |
| UNIQUE     | • Searches every row of a specified table for uniqueness                                    |
